

## DESIGNATED LABORATORIES FOR JOHNE'S DISEASE TESTING

- The Johne's Disease Implementation Group has designated the following laboratories to test blood, milk or faeces samples taken as part of the Animal Health Ireland Johne's Disease Control Programme.
- You may send samples to the laboratory of your choice.

| Johne's Disease  |   |  |  |                    |                                     |                 |
|--|---|--|--|--------------------|-------------------------------------|-----------------|
| <p>Below is a list of the diagnostic laboratories currently designated by the Johne's Disease Implementation Group to provide testing in support of the Johne's Disease Control Programme, the test and sample types to which this designation refers and the accreditation status of these tests.</p> |   |  | <p>INAB (<a href="http://www.INAB.ie">www.INAB.ie</a>) is the national body providing accreditation to the ISO 17025 standard.</p> |                    | Key                                 |                 |
|  |   |  |  |                    | Accredited to ISO17025 by INAB/UKAS |                 |
|  |   |  |  |                    | B                                   | Blood           |
|  |   |  |  |                    | Mi                                  | Individual Milk |

## Disclaimer

Blood and milk tests for Johne's disease detect the antibody response of the animal to the bacteria that causes Johne's Disease. However, this response typically does not develop for some years after infection. Therefore, it is probable that a significant proportion of infected animals will not be detected by any of the currently available tests, particularly the first time that a herd is screened. Also, while most positive test results reflect the true infection status of the animal, it is likely that a small proportion of uninfected animals may give positive test results. In such instances it is recommended that the animal be further tested using a dung sample to detect the bacteria that causes Johne's Disease (Map). It should be noted however that some infected animals will have positive test results using blood or milk and negative test results using dung samples. Also, Map can occasionally be detected in faeces taken from uninfected animals that have consumed faecal material from a shedding animal. This phenomenon of 'pass through' is more likely to occur in heavily infected herds. For this reason, faecal culture and PCR should be restricted to those animals that have a detectable antibody response. In all cases the interpretation of test results should be carried out in conjunction with the AHI approved veterinary practitioner who carried out the on-farm risk assessment and (if different) with your own vet.

All designated laboratories are independently accredited for Johne's testing and the test method used (ELISA/PCR). Results relate only to the sample as received by the laboratory and, whilst laboratories warrant that their tests will meet their applicable declared specifications, the laboratories make no other warranty, expressed or implied and accept no responsibility or liability in respect of false results which are within the limits of the declared specifications of the tests offered. No representation or warranty is given by AHI, ICBF, the Technical Working Group, the Implementation Group or any member, employee or other person connected with any of the foregoing bodies as to the accuracy of any Johne's test method or test result. Neither AHI, ICBF, the Technical Working Group, the Implementation Group nor any member, employee or other person connected with any of the foregoing bodies shall have any liability or responsibility in respect of any laboratory or the accuracy of any test methods, test results or reports produced by any laboratory.
